GARDEN CALORE®

NATURAL

ORGANIC FERTILISER &
SOIL CONDITIONER

GARDER GALORE®

ORGANIC PELLETISED FERTILISER

The Unique Fertiliser and Soil Conditioner

- ★ **Easy and clean to apply**
- ★ **No chemical additives**
- ★ **Safe to use on everything**

® is an organic pelletised fertiliser. The pellet is hard and dry and very easy to use. When the pellets come in contact with the soil they absorb moisture both from the soil and rain, then swell and breakdown to fine particles of manure. This carries down into the soil to provide an essential blend of plant nutrients and trace elements. The pellets contain a small proportion of wool which acts as an excellent conditioner.

® is 100% organic and unique in the fact that it is a source of both fast and slow release Nitrogen and Phosphorus. Essential for plants with a longer growing period e.g. Fruit and Ornamental trees, shrubs, etc.

® consists of:

Nitrogen (N) 4%
Phosphate (P) 1.4%
Potassium (K) 3%

also contains

Calcium (Ca)
Sodium (Na)
Magnesium (Mg)
plus a wide range of trace elements

® can be used on all plants with No FEAR of ROOT BURN.

® performs well on:

Kiwifruit
Ornamental and Fruit Trees
Shrubs
Roses
Vegetables

KIWIFRUIT

Planting: at planting incorporate 0.7 kgs ® into the soil in the planting hole. This should be well mixed in to the soil to give an even spread of Galore in the planting hole to promote and even root system.

One Year: The application rate recommended on 1 year plants is 1 kg per plant as a side dressing. This can be increased to 1.5 kg per plant if the plant has not made good growth in its first year. This application should be made in the spring.

Two Years Upwards: The recommended application rate is 1 — 1.75 kgs per plant as a side dressing in the spring.

SHELTER BELTS

® is strongly recommended to be cultivated into the soil before planting shelter trees. The Galore should be applied at a rate of 33.3 kg bag per 50 metres x 1 meter strip. A side dressing should be applied every spring thereafter.

TREE PRODUCTION

® has been on trial in Nurseries on Tree Production and has shown amazing results.

Benefits

- ★ The trees develop a far greater number of fine roots. The root system develops evenly in a greater ratio.
- ★ As ® promotes fine roots, there is no thick tap root growing feet into the seedbed. Therefore the trees can be lifted from soil with less root damage and energy.
- ★ The soil is left very friable after the trees have been lifted, not packed in large hard clumps.
- ★ In all the trials done to date, ® has produced approximately 21% greater root growth and 24% greater tree growth.
- ★ In the trials, ® is the most fertiliser tested.

Application Rate: Tree Production

® should be rotary hoed into the seedbed at .75 kg per square metre or one 33.3 kg bag per 50 metres x 1 metre strip.

MARKET GARDENING

® should be used in the same way as other organic fertilisers available. For best results, the Galore should be spread on top of the soil and then rotary hoed in.

The advantage of Garden Galore over other organic fertilisers on the market is its ability to condition soil into a free flowing state.

® **The All Round Cost Efficient Fertiliser**
